$$\delta: Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R\}$$

Γ : tape alphabet

contains Σ : input alphabet as well as some additional symbols including $\$$

The machine keeps executing until

- ① the next move is undefined
- ② It reaches a final state $q_f \in F$

Initially - the machine is in state q_0 and the tape head is on the left most cell

$\alpha q \beta$ contains all the necessary information for the computation till a certain juncture

q is positioned on the leftmost symbol of β

$$\alpha, \beta \in \Gamma^*$$

$q \in Q$ $\alpha q \beta$ represent the instantaneous description of Turing Machine

Initially the I.D.

$$(\epsilon, q_0, I_n)$$

I_n : input of length n

$$\alpha_i q_i \beta_i \vdash \alpha_{i+1} q_{i+1} \beta_{i+1} \vdash \dots$$

Suppose

$$00 q_2 \circ 01 \vdash 0 q_3 \circ 001$$

$$\delta(q_2, 1) \text{ contains } (q_3, 0, L)$$

$$L = \{ a^n b^n c^n, n \geq 1 \}$$

Multi track Turing Machine

$$\delta: Q \times \underbrace{\Gamma^1 \times \Gamma^2 \times \dots \times \Gamma^t}_{\Gamma^t} \rightarrow Q \times \Gamma^1 \times \Gamma^2 \times \dots \times \Gamma^t \times \{L, R\}$$

Claim Multitrack can be simulated by a normal 1 track machine.
 (by blowing up the tape alphabet)

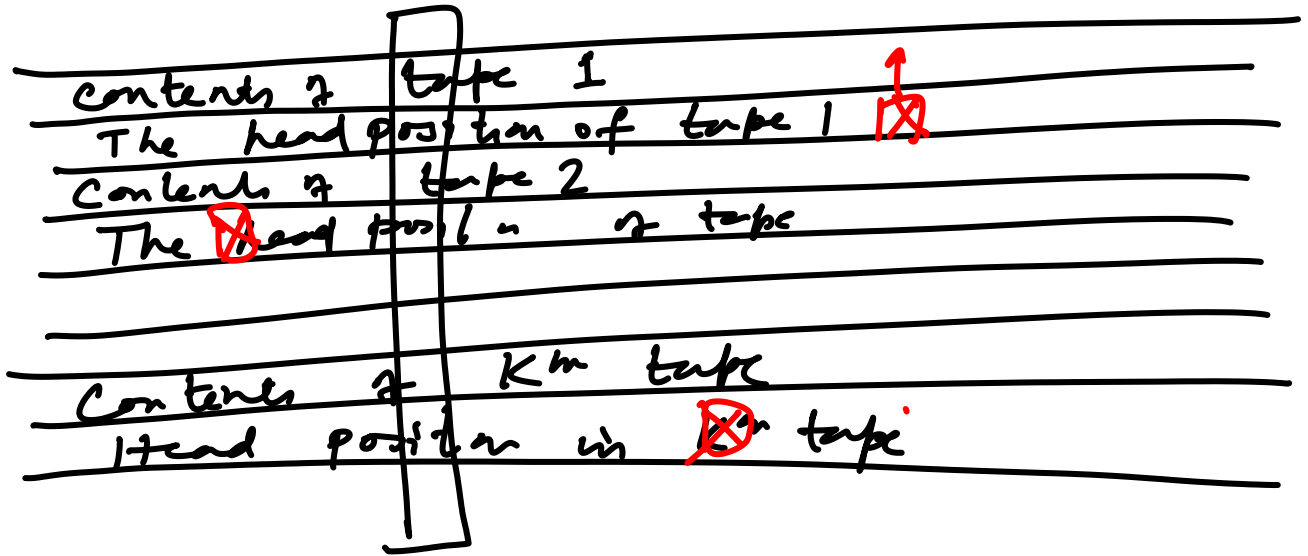

Multithead Turing Machine

k tapes

$$\delta : Q \times \underbrace{\Gamma \times \Gamma \times \Gamma}_k \rightarrow Q \times \underbrace{\Gamma \times \Gamma \times \Gamma \times \dots \times \Gamma}_k \\ \times \{L, R\}^k$$

Simulate a K multitape TM by a
Multitrack 2k track TM

The head scans from leftmost cell till it has counted K markers (must be done using some special states)

2nd scan : it replaces the symbols according to the δ function of the multitape machine

How do we remember the # head markers as we scan from left to right. The state space of the

multitrack machine can be as follows
 [\uparrow , 0/1, , , ,]
 ← we have counted the head on the K_m track

scanning for head position/replacing the tape symbols

Suppose the multi-tape TM
takes T steps

How many steps (in O notation)
will the simulator take?

about $O(T^2)$
