# COL351: Analysis and Design of Algorithms 

Ragesh Jaiswal, CSE, IITD

## Divide and Conquer

## Divide and Conquer

Closest pair of points on a plane

## Problem

You are given $n$ points on a two dimensional plane. Each point $i$ is defined by a pair $(x(i), y(i))$ of coordinates. Design an algorithm that outputs the closest pair of points.

## Divide and Conquer

Closest pair of points on a plane

## Problem

You are given $n$ points on a two dimensional plane. Each point $i$ is defined by a pair $(x(i), y(i))$ of coordinates. Design an algorithm that outputs the closest pair of points.

- Brute-force algorithm: Consider all pairs and pick closest.
- Running time:

- Pick the closest pair among $\left(i_{L}, j_{L}\right),\left(i_{R}, j_{R}\right)$, and $(p, q)$.
- What is the running time of the above algorithm?

## Divide and Conquer

Closest pair of points on a plane

- Divide and Conquer: (Divide based on $X$-axis)
- Consider the left-half points $P_{L}$ and right-half points $P_{R}$.
- Recursively find the closest pair of points $\left(i_{l}, j_{L}\right)$ in $P_{L}$, and $\left(i_{R}, j_{R}\right)$ in $P_{R}$.
- Consider all pair of points $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$.
- Pick the closest pair among $\left(i_{L}, j_{L}\right),\left(i_{R}, j_{R}\right)$, and $(p, q)$.
- Let $x=x^{*}$ be a line along the $Y$-axis dividing the points into $P_{L}$ and $P_{R}$.
- Let $d$ be the distance between the closest pair of points in $P_{L}$ and $P_{R}$.
- Claim 1: For any pair of points $(p, q)$ such that $x(p)<x^{*}-d$ and $x(q) \geq x^{*}$, the distance between $p$ and $q$ is $\geq d$.
- Claim 2: For any pair of points $(p, q)$ such that $x(p) \leq x^{*}$ and $x(q)>x^{*}+d$, the distance between $p$ and $q$ is $\geq d$.

## Divide and Conquer

Closest pair of points on a plane

- Divide and Conquer: (Divide based on $X$-axis)
- Consider the left-half points $P_{L}$ and right-half points $P_{R}$.
- Recursively find the closest pair of points $\left(i_{l}, j_{L}\right)$ in $P_{L}$, and $\left(i_{R}, j_{R}\right)$ in $P_{R}$.
- Consider all pair of points $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$.
- Pick the closest pair among $\left(i_{L}, j_{L}\right),\left(i_{R}, j_{R}\right)$, and $(p, q)$.
- Let $x=x^{*}$ be a line along the $Y$-axis dividing the points into $P_{L}$ and $P_{R}$.
- Let $d$ be the distance between the closest pair of points in $P_{L}$ and $P_{R}$.
- Claim 1: For any pair of points $(p, q)$ such that $x(p)<x^{*}-d$ and $x(q) \geq x^{*}$, the distance between $p$ and $q$ is $\geq d$.
- Claim 2: For any pair of points $(p, q)$ such that $x(p) \leq x^{*}$ and $x(q)>x^{*}+d$, the distance between $p$ and $q$ is $\geq d$.
- This means that for pairs of points across the line $x=x^{*}$, we can throw any point in $P_{L}$ that has small $X$-coordinate and any point in $P_{R}$ that has large $X$-coordinate.
- Do these claims help in improving the running time?

## Divide and Conquer

Closest pair of points on a plane

- How many points are there in each "box"?

## Divide and Conquer

Closest pair of points on a plane

- Claim 3: Let $P$ be all the points that have $X$-coordinate between $\left(x^{*}-d\right)$ and $\left(x^{*}+d\right)$. Let $S$ be the sorted list of points in $P$ sorted in increasing order of their $Y$-coordinates. Consider any pair of points $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$ and the distance between $p$ and $q$ is at most $d$. Then there cannot be more than 10 points between $p$ and $q$ in the sorted list $S$.

- Consider a pair $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$ and distance between $p$ and $q$ is at most $d$.
- Let $y(p) \leq y(q)$. The case $y(q)<y(p)$ will be symmetric.

## Divide and Conquer

Closest pair of points on a plane

- Claim 3: Let $P$ be all the points that have $X$-coordinate between $\left(x^{*}-d\right)$ and $\left(x^{*}+d\right)$. Let $S$ be the sorted list of points in $P$ sorted in increasing order of their $Y$-coordinates. Consider any pair of points $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$ and the distance between $p$ and $q$ is at most $d$. Then there cannot be more than 10 points between $p$ and $q$ in the sorted list $S$.

- Consider a pair $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$ and distance between $p$ and $q$ is at most $d$.
- Let $y(p) \leq y(q)$. The case $y(q)<y(p)$ will be symmetric.
- $q$ can only belong to one of the shaded boxes.

## Divide and Conquer

Closest pair of points on a plane

- Claim 3: Let $P$ be all the points that have $X$-coordinate between $\left(x^{*}-d\right)$ and $\left(x^{*}+d\right)$. Let $S$ be the sorted list of points in $P$ sorted in increasing order of their $Y$-coordinates. Consider any pair of points $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$ and the distance between $p$ and $q$ is at most $d$. Then there cannot be more than 10 points between $p$ and $q$ in the sorted list $S$.

- Consider a pair $(p, q)$ such that $p$ belongs to $P_{L}$ and $q$ belongs to $P_{R}$ and distance between $p$ and $q$ is at most $d$.
- Let $y(p) \leq y(q)$. The case $y(q)<y(p)$ will be symmetric.
- $q$ can only belong to one of the shaded boxes.

## Divide and Conquer

Closest pair of points on a plane

## Algorithm

ClosestPair ( $P$ )

- ... //Base cases
- Sort the points in increasing order of $X$-coordinates and pick the median point ( $x^{*}, y$ )
- Partition $P$ into $P_{L}$ (all point $p$ with $x(p)<x^{*}$ ) and $P_{R}$ (all points with $x(p) \geq x^{*}$ )
- Let $\left(p_{L}, q_{L}\right) \leftarrow$ ClosestPair $\left(P_{L}\right)$
- Let $\left(p_{R}, q_{R}\right) \leftarrow$ ClosestPair $\left(P_{R}\right)$
- Let $(p, q)$ be the pair (among $\left(p_{L}, q_{L}\right)$ and $\left.\left(p_{R}, q_{R}\right)\right)$ with the smaller distance and let $d$ be this distance
- Let $S$ be the sorted list of points with $X$-coordinate between $\left(x^{*}-d\right)$ and ( $x^{*}+d$ )
- For $i=1$ to $|S|$
- For $j=1$ to 11
- If distance $(S[i], S[i+j])<d$
$-(p, q) \leftarrow(S[i], S[i+j])$
$-d \leftarrow \operatorname{distance}(S[i], S[i+j])$
- $\operatorname{Output}(p, q)$
- What is the running time of the above algorithm?

## Divide and Conquer
