## Divide and Conquer

## Divide and Conquer

Median finding

## Problem

Median Finding: Given an array of unsorted numbers and an integer $k$, design an algorithm that finds the $k^{\text {th }}$ smallest number in the array. Assume that $A$ contains distinct numbers.

## Divide and Conquer

Median finding

## Problem

Median Finding: Given an array of unsorted numbers and an integer $k$, design an algorithm that finds the $k^{\text {th }}$ smallest number in the array. Assume that $A$ contains distinct numbers.

## Algorithm

Kth-smallest-incomplete ( $A, k$ )

- Pick a number $p$ as pivot
- Partition the numbers in $A$ into $A_{L}$ (all numbers $<p$ ) and $A_{R}$ (all numbers $>p$ )
- If $\left(\left|A_{L}\right|=k-1\right)$, then return $(p)$
- If $\left(\left|A_{L}\right|>k-1\right)$, then
return(Kth-smallest-incomplete $\left.\left(A_{L}, k\right)\right)$
- If $\left(\left|A_{L}\right|<k-1\right)$, then
return(Kth-smallest-incomplete $\left.\left(A_{R}, k-\left|A_{L}\right|-1\right)\right)$

## Divide and Conquer <br> Median finding

## Problem

Median Finding: Given an array of unsorted numbers and an integer $k$, design an algorithm that finds the $k^{t h}$ smallest number in the array. Assume that $A$ contains distinct numbers.

## Algorithm

Kth-smallest-incomplete ( $A, k$ )

- Pick a number $p$ as pivot
- Partition the numbers in $A$ into $A_{L}$ (all numbers $<p$ ) and $A_{R}$ (all numbers $>p$ )
- If $\left(\left|A_{L}\right|=k-1\right)$, then return $(p)$
- If $\left(\left|A_{L}\right|>k-1\right)$, then return(Kth-smallest-incomplete $\left.\left(A_{L}, k\right)\right)$
- If $\left(\left|A_{L}\right|<k-1\right)$, then return(Kth-smallest-incomplete $\left.\left(A_{R}, k-\left|A_{L}\right|-1\right)\right)$
- What is the running time of this algorithm if the pivot is picked arbitrarily?

## Divide and Conquer <br> Median finding

## Problem

Median Finding: Given an array of unsorted numbers and an integer $k$, design an algorithm that finds the $k^{t h}$ smallest number in the array.
Assume that $A$ contains distinct numbers.

## Algorithm

```
Kth-smallest-incomplete( }A,k\mathrm{ )
```

- Pick a number $p$ as pivot
- Partition the numbers in $A$ into $A_{L}$ (all numbers $<p$ ) and $A_{R}($ all numbers $>p)$
- If $\left(\left|A_{L}\right|=k-1\right)$, then return $(p)$
- If $\left(\left|A_{L}\right|>k-1\right)$, then return(Kth-smallest-incomplete $\left.\left(A_{L}, k\right)\right)$
- If $\left(\left|A_{L}\right|<k-1\right)$, then

```
return(Kth-smallest-incomplete( }\mp@subsup{A}{R}{},k-|\mp@subsup{A}{L}{}|-1)
```

- What is the running time of this algorithm if the pivot is picked arbitrarily? $O\left(n^{2}\right)$

## Divide and Conquer

## Median finding

## Algorithm

Kth-smallest-incomplete ( $A, k$ )

- Pick a number $p$ as pivot
- Partition the numbers in $A$ into $A_{L}$ (all numbers $<p$ ) and $A_{R}($ all numbers $>p)$
- If $\left(\left|A_{L}\right|=k-1\right)$, then return $(p)$
- If $\left(\left|A_{L}\right|>k-1\right)$, then return(Kth-smallest-incomplete $\left.\left(A_{L}, k\right)\right)$
- If $\left(\left|A_{L}\right|<k-1\right)$, then
return(Kth-smallest-incomplete $\left.\left(A_{R}, k-\left|A_{L}\right|-1\right)\right)$
- How do we pick a good pivot number?
- Randomly: We will look at this later.
- Deterministically:

## Median finding

- Suppose we want to find the $12^{\text {th }}$ smallest element in the following array.

| 40 | 13 | 70 | 62 | 30 | 19 | 64 | 67 | 24 | 94 | 47 | 83 | 77 | 3 | 78 | 50 | 4 | 46 | 49 | 6 | 85 | 25 | 29 | 11 | 60 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 40 | 13 | 30 | 19 | 24 | 3 | 4 | 6 | 25 | 29 | 11 | 46 | 70 | 64 | 67 | 62 | 94 | 47 | 83 | 77 | 78 | 50 | 46 | 49 | 85 |
| 60 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

- Consider groups of 5 elements.
- Sort individual groups.
- Consider medians of each group.
- Make a recursive call to find median element of medians.
- Partition using the pivot as 46 .

## Divide and Conquer

## Median finding

- Consider groups of 5 elements.
- Sort individual groups.
- Consider medians of each group.
- Make a recursive call to find median element of medians.
- Partition using the pivot as 46 .

## Divide and Conquer

## Problem

Given two polynomials:
$A(x)=a_{0}+a_{1} \cdot x+a_{2} \cdot x^{2}+\ldots+a_{n-1} \cdot x^{n-1}$, and
$B(x)=b_{0}+b_{1} \cdot x+b_{2} \cdot x^{2}+\ldots+b_{n-1} \cdot x^{n-1}$, design an algorithm to that outputs $A(x) \cdot B(x)$.

## Divide and Conquer

## Problem

Given two polynomials:
$A(x)=a_{0}+a_{1} \cdot x+a_{2} \cdot x^{2}+\ldots+a_{n-1} \cdot x^{n-1}$, and $B(x)=b_{0}+b_{1} \cdot x+b_{2} \cdot x^{2}+\ldots+b_{n-1} \cdot x^{n-1}$, design an algorithm to that outputs $A(x) \cdot B(x)$.

- We have to obtain the polynomial $C(x)=A(x) \cdot B(x)$
- $C(x)$ may be written as:

$$
C(x)=c_{0}+c_{1} \cdot x+c_{2} \cdot x^{2}+\ldots+c_{2 n-2} \cdot x^{2 n-2}
$$

- What is $c_{i}$ in terms of coefficients of $A$ and $B$ ?

## Divide and Conquer

## Fast Fourier Transform

## Problem

Given two polynomials:
$A(x)=a_{0}+a_{1} \cdot x+a_{2} \cdot x^{2}+\ldots+a_{n-1} \cdot x^{n-1}$, and $B(x)=b_{0}+b_{1} \cdot x+b_{2} \cdot x^{2}+\ldots+b_{n-1} \cdot x^{n-1}$, design an algorithm to that outputs $A(x) \cdot B(x)$.

- We have to obtain the polynomial $C(x)=A(x) \cdot B(x)$
- $C(x)$ may be written as:
$C(x)=c_{0}+c_{1} \cdot x+c_{2} \cdot x^{2}+\ldots+c_{2 n-2} \cdot x^{2 n-2}$
- What is $c_{i}$ in terms of coefficients of $A$ and $B$ ?
- $c_{i}=a_{i} \cdot b_{0}+a_{i-1} \cdot b_{1}+\ldots+a_{0} \cdot b_{i}$
- The vector $\left(c_{0}, \ldots, c_{2 n-2}\right)$ is called the convolution of vectors $\left(a_{0}, \ldots, a_{n-1}\right)$ and $\left(b_{0}, \ldots, b_{n-1}\right)$.

## Divide and Conquer

## Algorithm

$$
\begin{aligned}
& \text { SimpleMultiply }\left(\left(a_{0}, \ldots, a_{n-1}\right),\left(b_{0}, \ldots, b_{n-1}\right)\right) \\
& \quad \text { - For } i=0 \text { to } 2 n-2 \\
& \quad-\text { For } j=0 \text { to } i \\
& \quad-c_{i} \leftarrow c_{i}+a_{j} \cdot b_{i-j} \\
& \text { - return }\left(\left(c_{0}, c_{1}, \ldots, c_{2 n-2}\right)\right)
\end{aligned}
$$

- What is the running time of the above algorithm?

## Divide and Conquer

## Algorithm

$$
\begin{aligned}
& \text { SimpleMultiply }\left(\left(a_{0}, \ldots, a_{n-1}\right),\left(b_{0}, \ldots, b_{n-1}\right)\right) \\
& \text { - For } i=0 \text { to } 2 n-2 \\
& \quad \text { - For } j=0 \text { to } i \\
& \quad-c_{i} \leftarrow c_{i}+a_{j} \cdot b_{i-j} \\
& \text { - return }\left(\left(c_{0}, c_{1}, \ldots, c_{2 n-2}\right)\right)
\end{aligned}
$$

- What is the running time of the above algorithm? $O\left(n^{2}\right)$
- Is there another way to compute the polynomial $C(x)$ ?

## Divide and Conquer

- Another way to compute the polynomial $C(x)$ :
- Compute $A\left(s_{1}\right), A\left(s_{2}\right), \ldots, A\left(s_{2 n}\right)$.
- Compute $B\left(s_{1}\right), B\left(s_{2}\right), \ldots, B\left(s_{2 n}\right)$.
- Compute:
- $C\left(s_{1}\right)=A\left(s_{1}\right) \cdot B\left(s_{1}\right)$
- $C\left(s_{2}\right)=A\left(s_{2}\right) \cdot B\left(s_{2}\right)$
$-$
- $C\left(s_{2 n}\right)=A\left(s_{2 n}\right) \cdot B\left(s_{2 n}\right)$
- Interpolate to obtain the polynomial $C(x)$.

## Divide and Conquer

Fast Fourier Transform

- Another way to compute the polynomial $C(x)$ :
- Compute $A\left(s_{1}\right), A\left(s_{2}\right), \ldots, A\left(s_{2 n}\right)$.
- Compute $B\left(s_{1}\right), B\left(s_{2}\right), \ldots, B\left(s_{2 n}\right)$.
- Compute:
- $C\left(s_{1}\right)=A\left(s_{1}\right) \cdot B\left(s_{1}\right)$
- $C\left(s_{2}\right)=A\left(s_{2}\right) \cdot B\left(s_{2}\right)$
- :
- $C\left(s_{2 n}\right)=A\left(s_{2 n}\right) \cdot B\left(s_{2 n}\right)$
- Interpolate to obtain the polynomial $C(x)$.
- How fast can you compute $A(s)$ given value of $s$ ?

## Divide and Conquer

## Fast Fourier Transform

- Another way to compute the polynomial $C(x)$ :
- Compute $A\left(s_{1}\right), A\left(s_{2}\right), \ldots, A\left(s_{2 n}\right)$.

\vdots \\
C\left(s_{2 n}\right)
\end{array}\right)
$$

- Is the above square matrix invertible?
- Fact: A square matrix is invertible iff its determinant is non-zero.
- The square matrix above has a special name: Vandermonde matrix.

## Divide and Conquer

- Fact: A square matrix is invertible iff its determinant is non-zero.
- The square matrix above has a special name: Vandermonde matrix.
- Claim 1: For any Vandermonde matrix $V$ shown below,

$$
V=\left(\begin{array}{ccccc}
1 & s_{1} & \left(s_{1}\right)^{2} & \ldots & \left(s_{1}\right)^{2 n-1} \\
1 & s_{2} & \left(s_{2}\right)^{2} & \ldots & \left(s_{2}\right)^{2 n-1} \\
1 & s_{3} & \left(s_{3}\right)^{2} & \ldots & \left(s_{3}\right)^{2 n-1} \\
\vdots & \vdots & \vdots & \vdots & \vdots \\
1 & s_{2 n} & \left(s_{2 n}\right)^{2} & \ldots & \left(s_{2 n}\right)^{2 n-1}
\end{array}\right)
$$

$\operatorname{Det}(V)=\prod_{1 \leq j<i \leq 2 n}\left(s_{i}-s_{j}\right)$.

## Divide and Conquer

## Fast Fourier Transform

- Fact: A square matrix is invertible iff its determinant is non-zero.
- The square matrix above has a special name: Vandermonde matrix.
- Claim 1: For any Vandermonde matrix $V$ shown below,

$$
V=\left(\begin{array}{ccccc}
1 & s_{1} & \left(s_{1}\right)^{2} & \ldots & \left(s_{1}\right)^{2 n-1} \\
1 & s_{2} & \left(s_{2}\right)^{2} & \ldots & \left(s_{2}\right)^{2 n-1} \\
1 & s_{3} & \left(s_{3}\right)^{2} & \ldots & \left(s_{3}\right)^{2 n-1} \\
\vdots & \vdots & \vdots & \vdots & \vdots \\
1 & s_{2 n} & \left(s_{2 n}\right)^{2} & \ldots & \left(s_{2 n}\right)^{2 n-1}
\end{array}\right)
$$

$\operatorname{Det}(V)=\prod_{1 \leq j<i \leq 2 n}\left(s_{i}-s_{j}\right)$.

- So, as long as we use distict values of $s_{1}, \ldots, s_{2 n}$, we will be able to do polynomial interpolation.

## End
