# COL106: Data Structures and Algorithms 

Ragesh Jaiswal, IIT Delhi

## Course Overview

- Basic graph algorithms
- Algorithm Design Techniques:
- Greedy Algorithms
- Divide and Conquer
- Dynamic Programming
- Network Flows
- Computational Intractability

## Divide and Conquer

## Divide and Conquer

- You have already seen multiple examples of Divide and Conquer algorithms:
- Binary Search
- Merge Sort
- Quick Sort
- Multiplying two $n$-bit numbers in $O\left(n^{\log _{2} 3}\right)$ time.

## Divide and Conquer

## Main Idea

- Main Idea: Divide the input into smaller parts. Solve the smaller parts and combine their solution.

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Example: Consider the integers sequence $A=[7,2,8,3,4,1,9,10]$
- What is the total number of inversions?

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Example: Consider the integers sequence $A=[7,2,8,3,4,1,9,10]$
- What is the total number of inversions? 10

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Naïve algorithm: Check $A[i], A[j]$ for all pairs $i<j$.
- Running time of the naïve algorithm?

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Naïve algorithm: Check $A[i], A[j]$ for all pairs $i<j$.
- Running time of the naïve algorithm? $O\left(n^{2}\right)$

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Divide and conquer strategy:
- Divide the array into two parts $A_{L}$ and $A_{R}$
- Count the number of inversions $c_{L}$ in $A_{L}$
- Count the number of inversions $c_{R}$ in $A_{R}$
- Count the number of inversions $c_{L R}$ across $A_{L}$ and $A_{R}$
- Output $c_{L}+c_{R}+c_{L R}$

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Divide and conquer strategy:
- Divide the array into two parts $A_{L}$ and $A_{R}$
- Count the number of inversions $c_{L}$ in $A_{L}$
- Count the number of inversions $c_{R}$ in $A_{R}$
- Count the number of inversions $c_{L R}$ across $A_{L}$ and $A_{R}$
- Output $c_{L}+c_{R}+c_{L R}$
- How much time does it take to find the number of inversions across $A_{L}$ and $A_{R}$ ?
- If we can do this in $O(n)$ time, then the recurrence relation for the running time will be $T(n) \leq 2 \cdot T(n / 2)+c n$.
- The solution for the above is $T(n)=O(n \log n)$

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Divide and conquer strategy:
- Divide the array into two parts $A_{L}$ and $A_{R}$
- Count the number of inversions $c_{L}$ in $A_{L}$
- Count the number of inversions $c_{R}$ in $A_{R}$
- Count the number of inversions $c_{L R}$ across $A_{L}$ and $A_{R}$
- Output $c_{L}+c_{R}+c_{L R}$
- How much time does it take to find the number of inversions across $A_{L}$ and $A_{R}$ ?
- Suppose we have sorted $A_{L}$ and $A_{R}$, how much time does it take to count the inversions across $A_{L}$ and $A_{R}$ ?

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

- Divide and conquer strategy:
- Divide the array into two parts $A_{L}$ and $A_{R}$
- Count the number of inversions $c_{L}$ in $A_{L}$
- Count the number of inversions $c_{R}$ in $A_{R}$
- Count the number of inversions $c_{L R}$ across $A_{L}$ and $A_{R}$
- Output $c_{L}+c_{R}+c_{L R}$
- How much time does it take to find the number of inversions across $A_{L}$ and $A_{R}$ ?
- Suppose we have sorted $A_{L}$ and $A_{R}$, how much time does it take to count the inversions across $A_{L}$ and $A_{R}$ ? $O(n)$

## Divide and Conquer

Counting Inversions

## Problem

Counting inversions: Given a sequence of distinct integers, $A[1], A[2], \ldots, A[n]$ output the number of pairs $(i, j)$ such that $i<j$ and $A[i]>A[j]$. Such pairs are called inversions.

## Algorithm

SortCountInversions ( $A$ )

- if $(|A|=1)$ return $(0, A)$
- Let $A_{L} \leftarrow A[1] \ldots A[n / 2]$
- Let $A_{R} \leftarrow A[n / 2+1] \ldots A[n]$
- $\left(c_{L}, B_{L}\right) \leftarrow$ SortCountInversions $\left(A_{L}\right)$
- $\left(c_{R}, B_{R}\right) \leftarrow$ SortCountInversions $\left(A_{R}\right)$
- $\left(c_{L R}, B\right) \leftarrow \operatorname{MergeCount}\left(B_{L}, B_{R}\right)$
- return $\left(\left(c_{L}+c_{R}+c_{L R}\right), B\right)$

## Divide and Conquer

## Counting Inversions

```
Algorithm
SortCountInversions ( \(A\) )
    - if \((|A|=1)\) return \((0, A)\)
    - Let \(A_{L} \leftarrow A[1] \ldots A[n / 2]\)
    - Let \(A_{R} \leftarrow A[n / 2+1] \ldots A[n]\)
    - \(\left(c_{L}, B_{L}\right) \leftarrow\) SortCountInversions \(\left(A_{L}\right)\)
    - \(\left(c_{R}, B_{R}\right) \leftarrow\) SortCountInversions \(\left(A_{R}\right)\)
    \(-\left(c_{L R}, B\right) \leftarrow\) MergeCount \(\left(B_{L}, B_{R}\right)\)
    - return \(\left(\left(c_{L}+c_{R}+c_{L R}\right), B\right)\)
```

## Course Overview

- Graph Algorithms
- Algorithm Design Techniques:
- Greedy Algorithms
- Divide and Conquer
- Dynamic Programming
- Network Flows
- Computational Intractability

## Dynamic Programming

## Dynamic Programming <br> \section*{Main Ideas}

- Main idea: Break the given problem in to a few sub-problems and combine the solutions of the smaller sub-problems to get solutions to larger ones.
- How is it different than Divide and Conquer?
- Here you are allowed overlapping sub-problems.

## Dynamic Programming

Main Ideas

- Main idea: Break the given problem in to a few sub-problems and combine the solutions of the smaller sub-problems to get solutions to larger ones.
- How is it different than Divide and Conquer?
- Here you are allowed overlapping sub-problems.
- Suppose your recursive algorithm gives a recursion tree that has many common sub-problems (e.g., recursion for computing Fibonacci numbers), then it helps to save the solution of sub-problems and use this solution whenever the same sub-problem is called.
- Dynamic programming algorithms are also called table-filling algorithms

## Dynamic Programming <br> Longest increasing subsequence

## Problem

Longest increasing subsequence: You are given a sequence of integers $A[1], A[2], \ldots, A[n]$ and you are asked to find a longest increasing subsequence of integers.

- Example: The longest increasing subsequence of the sequence $\overline{(7,2,8,6}, 3,6,9,7)$ is ?

## End
